

Leaving TREATMENT

When is it time?

There is no brain scan or blood test to measure opiate receptors or endorphin levels. However, federally-funded studies and thousands of personal experiences consistently show how to have success in treatment.

WARNING

Leaving treatment early...

Leaving treatment prior to 12 months results in a 4x higher relapse rate. Don't take this risk. Take the time to succeed in treatment.

Successful Treatment...

If you want to approach treatment in a way that leads to success:

1. Reach a stable medication dose
2. Focus on recovery skills
3. Allow the brain to repair 6-12 months
4. Begin a trial period of tapering

ATTITUDE

QUESTIONS

But what about...

I see patients who have been on medication for years! Why? About 20% of patients have been using for so long or at such a high level, their brains are unable to reproduce endorphins and rebuild their receptors back to their original levels. But even these patients can have success in treatment.

What is success in treatment...

Whether tapering off medication or continuing on a maintenance dose, you can experience all the benefits of recovery - improved health, restored relationships, custody of children, continuing education or employment - and no more addictive behavior, wasted time and money.

SUCCESS

INSPIRE

Our goal...

Our goal is to INSPIRE you to reach your treatment goals. If you ever experience anything other than this from our staff, please let us know by texting the owner.

The number is posted in your Center.
